

Rio Siera Di Sappada

Create: 2023-03-09 20:50:31	Update: 2023-10-14 09:16:10	Print: 2025-04-28 09:04:11
Country: Italia / Italy Region: Friuli Venezia Giulia Subregion: Udine Town: Sappada		
Difficulty: not as difficult	Grading: v3 a2 III	Total time: 3h45
Approachtime: 55min	Tourtime: 2h30	Returntime: 20min
Altitude entry: 1550m	Altitude exit: 1200m	Delta Altitude: 350m
Canyon length: m	Highest rapell: 25m	Amount rapells:
Transport: on Foot	Rock type:	drainage area: km ²
Season:	Orientation:	Best Time:
Rating: ★ 3.1 (2)	Info: ★ 2 (1)	Belay: ★ 1 (1)
Specialities:		
Gear:		
Summary: (machine translated) Open and cut canyons passages alternate. An reasonable water thirst rate is lacking here mostly, so this tour is worthwhile rather after extensive rainfall. Attention: slippery!		
Hydrology:		
Access: (machine translated) On SR355 to Sappada. On the west side of the bridge over the Rio del Mulino (right bank) a road branches off down to the Piave. At the T-junction another 150m right to a reasonable parking lot next to the Piave River.		
Approach: (machine translated) At the parking lot, cross the Piave bridge and follow path 316 up through the forest. Later the path runs along the rock wall until a small log bridge over our stream. Get on here.		
Tour: (machine translated) The first open gorge cuts more and more and becomes increasingly a real canyon. If you do not immediately find the belystation in the lower third (where the gorge is darkest), look far to the right to spot the lonely anchor. The old hooks and slings at the last waterfalls probably come from ice climbing.		
Return: (machine translated) 20min of dull streambed hassle brings us back to the parking lot.		
Coordinates: Canyon Start 46.5486 12.6947 Parking Entry and Exit 46.5615 12.6879 Canyon End 46.5557 12.6952		
Reports:		
2024-06-04 Montie ★★★★★ 📖★★★ 🗎★ 🌊 High 🟢 Completed The description of the canyon makes you think that you should go in during high water levels, which I do not agree with. I suppose the description was written in the fall or in a dry summer, because on June 4th (and 3 days after a lot of rain) the water level during our descent (see pictures and video) would be what I would consider the maximum level with the current anchor situation. The anchor situation is currently bad - very bad! We had to place nuts and pitons on some rappels (unfortunately only brought a hand drill, did not want to spend too much time drilling). Next person to descend this canyon: please take a drill and a good amount of bolts :) The anchors are currently placed so that you have to take the most intense route straight through the water, which at higher water levels is uncomfortable or dangerous. This can easily be avoided with better anchor placement. Check the water level before you go (follow the path parallel to the Rio Siera the reach the point of the picture).
